

Aquafingers Aqua Cleaner Cleaning Guide

EQUIPMENT REQUIRED

AQUA CLEANER

AQUAFINGERS®

POOL NET

BUCKET

WATERING CAN

STANDARD VAC POLE

STEP 1

Remove all surface debris using a leaf net (ideally one with a scooped edging). You may find it easier to add water to the cover surface to help remove leaves etc.

STEP 2

Pour cover cleaning solution over entire surface area using a watering can and leave for 10 minutes.

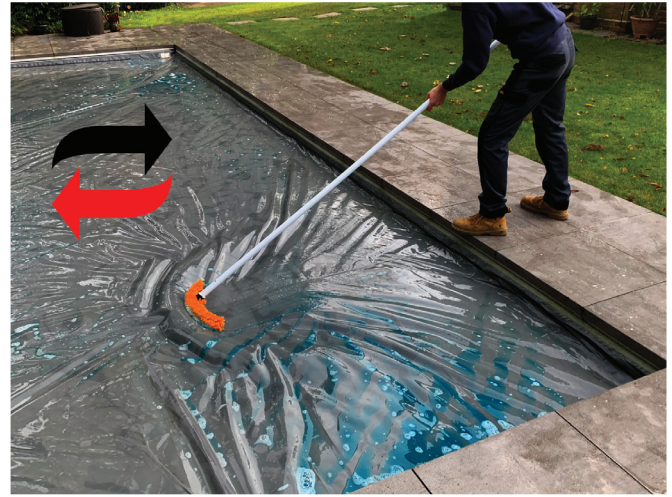

Aqua Cleaner is highly concentrated, for general cleaning the solution is diluted to a ratio of 5:1. For soiled pool covers we recommend using at a ratio of 2:1 (0.5 litres per 10 sqm of cover area). For heavy soiled fabrics the Aqua Cleaner can be used neat.

STEP 3

Using an Aqua Fingers® pool brush scrub the safety cover material using a vigorous back and forth motion.

For stubborn soiled areas such as tide marks, welded seams and hems etc, invert the brush and create a 'V' type shape by simply moulding into shape with your hands. This helps to create more cleaning pressure

STEP 4

Once all the dirt/tide marks have been removed, open the pool cover in one metre increments and rinse off using a hose pipe directing the soiled water into the pit housing.

STEP 5

You may find a foam residue will be present over the cover surface. Open and close the cover rinsing off the foam whilst the cover is being removed. The Aqua Fingers® can also be used to help remove the foam suds too.

Repeat above operation until most of the foam has dissipated. Any remaining suds naturally disappear after approximately 30 minutes.

After 24hrs, check pH balance and adjust if necessary. Any soiled water that has entered the pool will be removed naturally by the filtration system.
